FEM could be applied for lots of fields like structural mechanics, fluid mechanics, electromagnetics, heat transfer etc. For any system, we tend to start with the objective laws ( mass, momentum and energy conservation) and derive the governing equations of that system which would be a boundary values problem / initial value problem.

The finite element method is the most widely used method for solving problems of engineering and mathematical models. Typical problem areas of interest include the traditional fields of structural analysis, heat transfer, fluid flow, mass transport, and electromagnetic potential. The FEM is a particular numerical method for solving partial differential equations in two or three space variables. To solve a problem, the FEM subdivides a large system into smaller, simpler parts that are called fini
